

Shokunin v4.0

Memory System — Complete Rewrite · May 2026

What Changed

The memory system was completely overhauled. Before, it had 3 critical bugs that prevented any real data capture. Now it has 3 layers of redundancy, structured data types, and automated session capture. Here is exactly what changed and why.

Layer 1 — The Agent (CLAUDE.md + MCP Server)

Before	After
CLAUDE.md said "save at end" vaguely	Precise instructions for 4 save triggers: decision, file change, command, checkpoint every 3-5 turns, plus a mandatory session_end summary
mcp-server.py had a bug : CHROMA_PATH = r"os.path.join(...)" — a string literal, not a function call. ChromaDB silently fell back to its default directory.	Fixed: CHROMA_PATH = os.path.join(os.environ["USERPROFILE"], ...)
3 tools: store, search, get_summary	Same 3 tools, but store_context now accepts a type field (decision, file, command, preference, checkpoint, session_end, general) and search_context accepts n_results and type filters
No logging	Logs writes, errors, and warnings to ~/.shokunin/memory/mcp-server.log
No markdown backup	Every store also writes to sessions/*.md as a readable fallback

Layer 2 — The Wrapper (run-opencode.ps1)

Before	After
Saved a dummy placeholder: "SESSION: xxx\nFECHA: xxx"	Expands console buffer to 9999 lines, runs opencode, reads the entire buffer after exit, strips ANSI codes, saves structured content to ChromaDB
Called MCP server incorrectly (one-shot pipe to a persistent process)	Uses chroma-helper.py — a direct Python script that writes to ChromaDB without the MCP protocol
No session ID handling	Generates session-YYYYMMDD-HHMMSS-NNNN IDs that are passed to the agent's CLAUDE.md instructions

Layer 3 — The Scripts

Script	Before	After
save-memory.ps1	Broken — sent JSON to python -c "" via pipe, which ignored the input. Returned fake success.	Uses chroma-helper.py to save directly. Falls back to sessions/*.md if ChromaDB is unavailable.
search-memory.ps1	Grep-only in sessions/*.md (no semantic search)	Unified: tries ChromaDB first (semantic), falls back to grep, merges results by relevance
chroma-helper.py	— (new)	Direct ChromaDB access for PowerShell scripts. Commands: save, search, count
read-transcript.ps1	— (new)	Strips ANSI codes from console buffer dump, extracts decisions and commands, generates structured markdown
test-memory.ps1	— (new)	Validates: Python available, files exist, ChromaDB save/search/count, MCP server responds, all scripts parse correctly, CLAUDE.md and AGENTS.md have memory sections

Architecture Overview

Bugs Fixed

1	mcp-server.py line 10: r"os.path.join(...)"	String literal instead of function call — ChromaDB consistently computed the wrong path
2	save-memory.ps1: \$payload python -c """	The -c script ignored stdin. Saved reported success but did nothing
3	run-opencode.ps1: placeholder summary	Saved "SESION: xxx" dummy text, not actual conversation content
4	MCP server call from wrapper	Pipe JSON to a persistent stdin/stdout process = hang. Now uses chroma-helper.py

Data Format

Each memory entry now stores structured metadata:

```
{
  "type": "decision | file | command | preference | checkpoint | session_end",
  "timestamp": "2026-05-14T10:30:00Z",
  "project": "project-name",
  "tags": ["auth", "jwt", "decision"],
  "session_id": "session-20260514-103000-A7F3",
  "text": "Context-rich description of what happened, what was decided, and why"
}
```

What This Means For You

- **No more lost context.** When you start a new session, the agent will show you what you were working on before.
- **No more setup.** Everything saves automatically — the wrapper captures the console buffer and the agent saves during the session.
- **No more silent failures.** The test script validates all memory components in one command.
- **Backward compatible.** Existing ChromaDB data is untouched. Existing skill files unchanged.

Files Changed

File	Action
<code>.pack/memory/mcp-server.py</code>	Fixed + improved
<code>.pack/scripts/run-opencode.ps1</code>	New
<code>.pack/scripts/save-memory.ps1</code>	Rewritten
<code>.pack/scripts/search-memory.ps1</code>	Rewritten
<code>.pack/scripts/chroma-helper.py</code>	New
<code>.pack/scripts/read-transcript.ps1</code>	New
<code>.pack/scripts/test-memory.ps1</code>	New
<code>.pack/CLAUDE.md</code>	Updated
<code>.pack/AGENTS.md</code>	Updated
