

AI Engineering Ecosystem for OpenCode. 35 skills, ChromaDB memory, MCP servers. Zero cost, open source.

What is Shokunin?

Shokunin (職人, Japanese for artisan) turns OpenCode into a production AI coding agent with specialized skills, persistent memory across sessions, and weekly automation. All components are free and open source — the AI runs on NVIDIA's free API tier or Ollama locally.

One command install: `irm https://raw.githubusercontent.com/EliasOulkadi/shokunin/master/install.ps1 | iex`

What You Get

35 Skills

Infrastructure, backend, frontend, mobile, content, business, documents. Auto-activate by describing your task.

ChromaDB Memory

Persistent context across sessions. Agent remembers what you did before. ~400 KB on disk.

MCP Servers

Filesystem, fetch, memory. Give the agent real access to your system and the web.

Subagents

Code review and debugger with Ollama fallback for offline use.

How It Works

When you describe a task, OpenCode reads the skill descriptions and activates the one that matches. Each skill has a procedural workflow, error handling, production checklist, and anti-patterns. The advanced ones include executable PowerShell scripts.

Memory saves context at session end and retrieves it at session start. No more repeating yourself between sessions.

Skills Overview

Domain	Skills	Best for
Infrastructure	docker, kubernetes, terraform, ci-cd, db-admin	Containerize, deploy, manage infrastructure
Backend	auth-architect, api-forge, db-sculptor, error-handler	Authentication, APIs, databases, observability
Frontend	component-forge, responsive-engine, motion-craft, landing-craft, ui-ux-pro-max	Components, responsive layouts, animations, landing pages
Mobile	flutter, react-native	Cross-platform mobile apps
Quality	test-commander, performance-profiler	Testing, Lighthouse, Core Web Vitals
Content & Business	communication, content-marketing, business-proposals, seo-geo, translate-craft	Emails, blog posts, proposals, SEO, translations
Documents	kami, portfolio-auto	Professional PDFs, portfolio sync
Productivity	git-workflow, windows-powershell, strategy, design, documentation, runbook-gen, finance, legal-counsel	Git automation, system admin, planning
System	memory, chromadb, whendone-plus	Memory management, notifications

Example Workflows

Building a feature

"Add login to my app" → auth-architect activates. Generates OAuth2 + JWT + session management + rate limiting.

"Dockerize it" → docker activates. Multi-stage Dockerfile + compose + vulnerability scan.

"Deploy to Kubernetes" → kubernetes + ci-cd activate. Manifests + Gateway API + pipeline with rollback.

Creating content

"Write a blog post" → content-marketing activates. PAS framework + headline + SEO structure.

"Export as PDF" → kami activates. Generates styled PDF with parchment design system.

System maintenance

"Check system health" → windows-powershell activates. Reports CPU, RAM, disk, uptime, pending updates.

"Backup the database" → db-admin activates. pg_dump + verification + WAL archiving.

Quick Commands

Command	Result
opencode	Start AI session with memory loaded
gst / ga / gc / gp / gl	Git aliases: status, add, commit, push, pull
ni / nrd / nrb / nt	npm aliases: install, run dev, run build, test
dps / dlog / dstop	Docker aliases: ps, logs, stop
mkcd / touch / admin	Utils: mkdir+cd, touch file, run as admin

Requirements

Windows 10/11, Node.js 18+, Python 3.11+ (optional, for ChromaDB memory), Git. All free.

New to OpenCode? Install it: `npm install -g opencode` . Get a free NVIDIA API key at build.nvidia.com. Then run the Shokunin installer above.
